Bug fixes

I added a class to encapsulate the HTTP POST requests. This reduces on the total code quite a bit.

I added logging if a login or update fails. The timestamp is logged as well if there was any specific error message.

Luke uploaded the mood list creation code to the server. I am now parsing the mood list from the generated XML document.

I added a tabbed pane. Once the display friends code is working, you will be able to tab between update and friends entries.

I need to finish the reporting code. I would like to get the server aspect done soon. Once that is done, the client code is mostly in place.

Testing Mac OS installer

I upgraded my installed copy.

Testing a GUI feature

I am trying to see if I can recreate a GUI bug.

New features

I'm working on the next alpha release.

Major changes:

1) A tabbed view will be used for updating, displaying friends, and updating client preferences.

2) Some preferences have been implemented. Auto login, default security levels, auto formatting and allowing comments preferences are implemented. More will be added in the future.

3) Reporting bug system will be implemented in the alpha. It's not completed right now, but it will be done before I release the alpha.

Displaying friends will not work in the alpha. Some of the code has been implemented, but it will not be in production for the next alpha release.

Website

Part of the website is live. The first page, download page and Tigress' picture are posted.

Winter Break is almost here

I should get the next version of Java JustJournal out this break.

There's only a few minor things I want to work on before I release the next alpha.
