Powerful zune vs ipod touch

More and more digital products on the markets for us to choose, because of all kinds of reasons, people just like to choose the best one for themselves. Zune and iPod touch, it is really a difficult choice for so many people. Do you think which one is better? Are you confused of choosing iPod Touch or Zune? Here we list several features by comparing zune

vs ipod touch. Zune and iPod Touch has their own advantages and disadvantages respectively. Read on to know more.

We can easily know that the two players only match up head-to-head in the 32GB size, where Apple's iPod sells for \$299 and the Zune HD sells for \$290, and almost-negligible price difference for most folks debating between the two. Apple's top-shelf 64GB player sells for \$399, but Microsoft offers no comparable Zune HD in that capacity. Although Apple has the cheapest entry-level model, we have to hand the price war victory to Microsoft, which has managed to skim just enough off the price to make non-Apple-devotees look twice before leaping. The winner is Microsoft Zune.

As iPod Touch owners can attest, the diversity of offerings in Apple's App Store makes the device as much a portable computer as it is a personal media player. You can create and edit calendars on it, surf the Web, and even find nearby places to eat with Google Maps and its built-in GPS. If the App Store is leafy oak tree, full of 75,000 apps and counting, Microsoft's app offering is a seedling starving for water. At launch, Microsoft offers only six apps, including a few games and some basic utilities like a weather app and calculator. Winner: Apple iPod Touch. From comparison Zune vs iPod Touch, Apple's iPod Touch remains the reigning champion of the touch screen. For someone with no interesting in piddling around with apps, looking solely for the ultimate personal media player, the Zune HD truly makes a better buy.

Different people have different attitudes to the same thing,
so we just choose the one that is more suitable for us.

iPad 2 smart cover is an essential part of your ipad

We all know iPad 2 is the hottest item all over the world now, more and more people fall in love with its powerful functions and more and more people become loyal Apple fans, they care about all information about Apple products, today i will bring some useful information to iPad 2 users, here i am glad to recommend you an essential part for your iPad 2-iPad 2 Smart Cover.

The new

iPad 2 Smart Cover is really a testament of how closely the team at Apple works towards creating integrated products. The design of smart cover clearly shows the attention to detail during the design process and providing solutions which just work. Apple has been intentional in the way they have marketed the new accessory which almost gives an impression that it is a part of the product rather than something which is an extra. I have never seen Apple marketing any accessory to such an extent that it features on almost all product description pages and introductory videos.

The iPad 2 Smart Cover makes iPad 2 do things no other cover can. Close it, and iPad automatically goes to sleep. Open it, and iPad instantly wakes up - no need to press any buttons. The iPad 2 Smart Covers doesn't just protect iPad, it keeps it ready to go whenever you are. As Steve Jobs explained, Apple designed the covers right alongside the iPad itself and, as he pointed out in true sound bite fashion, "it's not a case - it's a cover."

Even better, the iPad 2 Smart Cover doubles as the perfect movie-watching, game-playing, web-surfing, do-it-all companion. It folds in all the right places so you can quickly create a stand that holds iPad upright. Or one that lets you tilt iPad into a comfortable typing position. If you prefer to hold iPad, the Smart Cover flips back and out of the way like a page in a magazine. And if you want to shoot some HD video on the fly, the Smart Cover folds in half to expose the back-facing camera. Now that's something to smile about.

The Smart Cover makes iPad do things no other cover can. Close it, and iPad automatically goes to sleep. Open it, and iPad instantly wakes up - no need to press any buttons. The Smart Cover doesn't just protect iPad, it keeps it ready to go whenever you are. Set up for hands-free video calling - or watching. Just lean

iPad against the Smart Cover for a sturdy upright stand. The Smart Cover folds into the perfect typing stand. Its magnetic hinge holds iPad in place so you can type quickly and comfortably.

The magnetic Smart Covers, which also act as a stand for the tablet, come with bendable flaps that conform to the side of the device." You can add it in a second. You can remove it in a second," says Apple CEO Steve Jobs." You can have a bunch of them, and pick which one you feel like today and easily put it on."

We can see the importance of iPad 2 smart cover, it brings us more colorful and more interesting iPad 2 life.

If you want to transfer your iPad 2 videos to mac computer, you may use ipod to mac transfer.

More creative uses for your dead iPods

We all know that there is nothing lasts forever in the world, and iPod is also no exception. Like all electronic devices, your iPod will eventually take a trip to the big Apple Store in the sky. But that doesn't mean you can't still use it. There are many components that can die in an iPod: the hard drive, the flash memory, the screen, the backlight, or the actual digital signal processor (the chip that converts bits and bytes to notes). You can also ruin your headphone jack, making it impossible to listen to music by that route. Failures to any of these components can result in a dead iPod but, in some cases, even without going for a fix-up, you can still use the iPod in some way.

1. Use the iPod, but with limits

If you've got an iPod with a hard drive and the drive has cashed in its chips, then you won't be able to do much with it. It's probably best to go to an iPod repair service and have the hard drive replaced (or go the DIY route). However, in some cases, you can still use it—at least partially. I recently broke an iPod classic, dropping it on the floor (the first time I'd ever dropped it). Something happened to the hard drive, and when I try to load music, it now stops after about 20 GB of files. So I can still use it, at least for now, to play music; just with less capacity than the full 160 GB. If you drop yours, maybe you'll be lucky and get access to some of the hard disk.

2. Use it during the day, or under lights

One element that can fail is the iPod's backlight. If this happens, you'll still be able to see the screen if you hold it at the correct angle (though not in the dark—get into shuffling your songs!). If the screen itself is dead, you can get it fixed, and probably should if the iPod is recent enough. If not, you may still be able to use it to store files (see below).

3. Use an iPod as a source for iTunes

If your battery is dead—by far the most common failure on an iPod, and one that can happen after a few years—you may still be able to use it. (And you can replace the batteries easily on many

iPods, either on your own or by sending them to iPod repair shops.) Since all such an iPod is missing is juice, you can connect it to a computer and use it as a source, say to play music from your home collection when you're at work. Just connect it and launch iTunes, then check Manually Manage Music And Videos. Click the disclosure triangle next to the iPod, then click Music to browse your library, or choose one of the playlists it contains, and play the music the iPod holds through iTunes.

4. Use it as a source for your car

Just as in the above tip, you can connect your iPod to any source that provides power and use it for playback. If your car has a powered iPod connector (using the dock connector), just plug it in and turn up the music. The dock connector both provides power and handles music output. A cigarette-lighter adapter can also provide power if you're still using a cassette adapter or FM transmitter to play your music.

5. Connect the iPod to your stereo

Even with a dead battery, you can use your iPod as a source for a stereo, at home or in the office. You can connect it to any type of powered dock-either a standalone dock/speaker, or an Apple dock connected to a charger-then to a stereo, and your iPod can be your music source. In all three of these tips where you use the iPod as a source, you'll still be able to sync to it, because when you connect it to your computer, the iPod gets the power it needs.

6. Use your iPod to store files

Most iPods-except the shuffle, touch, and the iPhone-let you mount them as if they were hard drives. On the Summary window in iTunes, when the iPod is connected, check Enable Disk Use. This lets you use the iPod-even if, for example, the screen is broken and you can't navigate at all using the device's interface-to carry files from one location to another. Just like a USB thumb drive, your iPod can serve as a portable file receptacle. If you do this, you'll probably want to remove all its music first; the best way is just to restore the iPod and wipe it completely.

It is so useful for all ipod users, right? It is so surprise for us that we can still use the dead iPod in some way, so what have you done with dead iPods? Take action now and be more professional.

Gain more about Jailbreaking the iPad

So many people always pay attention to the powerful and functional iPad in the world and it is easy to know that the iPad has recently been jailbroken. Even if you've held off jailbreaking your other iPhone OS devices, the iPad's substantially faster hardware and difficult-to-define "3rd device" role make the best case yet for jailbreaking. A user- and developer-updated compatibility list will help you see what's safe to install on your iPad, and I'll list my favorite apps and extensions for your freshly jailbroken device.

Apple's App Store has become notorious for its restrictive and often arbitrary decisions about what does and doesn't make it into the store. We've seen many pieces of quality software get denied or kicked out of the App Store, sometimes for unclear or unknown reasons.

Many of these, however, have subsequently made their way into Cydia, the jailbroken app installer (note that the App Store works just fine on jailbroken devices, too). GV Mobile, a great interface for Google Voice, Dashboard, a clone of Mac OS X's Dashboard for iPad, and Wifi Sync, a paid application for performing iTunes syncs over Wi-Fi, are just a few examples. And there are plenty more programs and extensions that are available in Cydia that have never even been submitted to the App Store.

Besides these examples of nixed software, the world of jailbreaking also offers a multitude of tweaks that aren't available to the user on a normal iDevice, like changing system sounds or interface elements. While a much higher proportion of the software available through Cydia is free compared to what you'll find on the App Store, it does also contain paid software.

Many people express concern about jailbreaking their iPhones because they don't want to sacrifice stability or speed on their phones. While the vast majority of jailbreak software is perfectly stable, it's true that this software doesn't go through the same level of grueling testing to which Apple subjects software that makes it into the App Store. And software that lets you run 3rd-party programs in the background, otherwise change the interface, and so forth, can have effects on your device's performance, so I can understand why some people are reticent about this.

However, the iPad's processor and memory are substantially more powerful than that of the current iPhones and iPod Touches. Its hardware makes it much better suited to effective multitasking, and its role in most peoples' workflow makes a good for jailbreaking, both because jailbreaking makes it more useful, and because it simply won't be used the same way as your phone.

If jailbreaking means accepting a slightly lower standard of stability (which is debatable to begin with), it just isn't as crucial as on your phone. After all, the iPad is a device begging to be treated more like a computer than a phone, and jailbreaking makes that much more possible than Apple's approved software possibly can.

Once you're jailbroken, it's easiest just to back them up through Cydia. Alternatively, this method, using a program called Firmware Umbrella, works whether or not you are jailbroken, and is a good idea if you haven't yet but think you might want to in the future.

Finally, do keep in mind that jailbreaking voids your warranty as far as Apple is concerned, so always restore to an un-jailbroken state before taking your device to Apple for service.

More and more people take attention to useful tips on great jailbreak software, just want to be more professional, we all should take some actions to be more professional now.

Apple fans want the iPhone 5 to be able to do these 5 Things

With the gradual increase in people's lives, people want to enjoy more. We all know that technology is changing our lives, more and more people pay main attention to iPhone 5, because iPhone 4 can no longer meet the desire of people to enjoy. In fact, Apple hasn't even announced that the iPhone 5 even exists yet. But it's that time of the year when the previous model of the iPhone is just old enough that folks start clamoring for details about the next one. And because Apple is usually already working on the next big thing at this point, details start to leak out and people get hungrier and hungrier for the latest rumors about their beloved iPhones.

Earlier this week, the rumor mill started to produce a few details on the iPhone 5-namely that it may have a bigger screen, an improved antenna, and an 8-megapixel camera but no drastic changes to the design of the iPhone 4. So with people already speculating about it, we thought that now might be the perfect time to drop a list of the five things we want the iPhone 5 to be able to do when it arrives, presumably later this year. Some of these are very realistic, others not so much. But, hey, as we've seen, anything is possible when it comes to Apple. So we can dream, right?

1. Let us FaceTime with anyone who has a Webcam.

The FaceTime feature on the iPhone is pretty damn cool, even if you need a WiFi connection to use it. My problem is that I don't have many friends who own iPhones-or MacBooks, for that matter-so I've barely gotten the chance to use it. By opening up FaceTime or simply allowing the iPhone to handle video chatting with anyone with a Web cam, they'd open up the number of people who could use it and make it a feature that people would truly want. For ipod users,

ipod to mac transfer is such a wonderful tool and ipod transfer can be a good partner for Apple users to enjoy more. They are all functional softwares for users.

2. Hold more of our music!

As a recent convert to the iPhone, there was one thing that bothered me about it-the serious lack of space. I opted for the 16GB version on the Verizon network because, truthfully, even if I paid the extra 100 bucks for the 32GB version, it wouldn't have been able to hold anywhere near as much music as I'd like it to, so I'm still stuck carrying around an iPod and my iPhone most of the time. There's been talk of adding more storage (64GB? 128GB? 256GB?!?) to future iPhones and hopefully Apple takes that into serious account. It's not a huge deal right now, but if they want to sell people on the fact that they should ditch their MP3 players in place of the iPhone, this is a great place to start. More and more people have Apple products and more and more people will meet these questions, such as

how

to transfer music from ipod to computer and

how

to transfer music from ipod to ipod, etc. We all can easily get the best answers from internet, there are so many software tools that can help us to solve our problems.

3. Hold a better battery charge.

Admittedly, I'm not super familiar with how well the early versions of the iPhone worked as far as battery life is concerned. I know that Apple told me it was good and I even got to test out the iPhone 3 and iPhone 3GS and felt like both held a charge pretty well, but you never know how good a phone's battery is until you spend 24 hours a day with it for a few months. That said, I've

spent enough time with my iPhone 4 to know that it holds a charge pretty well, but it could be better. So I hope Apple continues to find ways to let me surf the Web, check my Facebook, and play 15 games of Words With Friends without draining my battery almost twice every day. In fact, I expect them to do as they've done with nearly every iPhone now.

4. Connect us to service on the 4G network.

It seems like it'll only be a matter of time before iPhones can be used on a 4G network, now that AT&T and Verizon are fighting for customers. Let's hope that happens sooner than later, though. Because I've seen more than a few Android-enabled phones (the HTC ThunderBolt comes to mind) that can do it and it really does make those phones look more appealing than the iPhone. It's such a superior phone in every other way, so why doesn't it run on the nation's fastest network yet? Let's just hope that the competition between AT&T and Verizon changes that quickly. Many people want to enjoy more from Apple, many people want to get the best answer of

how

to share music between ipods, you can search from google and you can get more useful and interesting information of comparing Zune vs iPod Touch.

5. Supersize our iPhone experience.

The Retina Display on the iPhone 4 is great. I didn't really think it would be as good as it is until I compared it to my iPod Touch and saw the difference. It really makes doing just about on the iPhone better and I dread having to use my Touch to look anything up now. But I hope Apple considers finding a way to make the iPhone 5's screen slightly bigger than the iPhone 4. The iPhone 4's screen is relatively small in comparison to most Android phones out there, so even a slight upgrade would make a big difference.

We're not asking for too much, just looking forward to see more surprises and happiness that iphone5 can bring to us.

It is a hot topic to know all things about Mac Scareware

More and more become Mac fans in the world, and more and more people pay attention to Mac news and information. If so, you can't miss this wonderful and useful article. The fact that Mac users have fallen victim to "scareware" scams -- the kind that have long plagued Windows users -- shouldn't come as a surprise. After all, fake antivirus software schemes like MacDefender don't have to rely on exploitable vulnerabilities, but instead typically depend on tricking users into visiting malicious sites and duping them into installing the software.

And Mac users, for all their pretensions otherwise, are as fallible as the next person. But from the news accounts this month about MacDefender, and the posts not only on Mac-specific blogs but also on ones usually devoted to Windows, you could be forgiven for thinking that Macs are suddenly the victims of choice. They're not. Windows machines remain the most common target because, well, globally Windows PCs outnumber Mac OS by more than 16-to-1. What is true is that Mac users now face the same scareware scams that Windows owners have had to deal with for years. So what's the deal? Macpocalypse or not? And what should you watch for, and what can you do to keep safe? Those are the questions we try to answer.

ipod to mac transfer is a good tool for Mac

users,

ipod transfer is another one.

Is MacDefender a worm? Nope. Although MacDefender and its ilk fall under the general term "malware" -- as in, it's malicious in some way -- it's not a virus, not a worm, not a true Trojan horse. Instead, it's one of a long line of "scareware" or "rogueware," terms that apply to fake -- hence "rogue" -- software that tries to spook you -- that's the "scare" -- into paying for a worthless program. The labels are usually slapped on phony security software that claims a computer is heavily infected with worms, viruses and other malware. Such software nags users with pervasive pop-ups and fake alerts until they fork over the "registration" fee, which in MacDefender's case ranges between \$60 and \$80.

The criminals monetize their work by collecting these fees.

And it's a profitable trade, at least where Windows scareware's concerned. Back in 2008, SecureWorks, now owned by Dell, said that some bad guys were making as much as \$5 million a year shilling scareware. So MacDefender isn't hacking my Mac? No. Although

scareware targeting Windows has been known to silently plant itself on PCs after other malware first exploits a security vulnerability in the OS or other software, MacDefender doesn't. That's a possible future move, of course, assuming attackers spend the time digging up an unpatched vulnerability in, say, Mac OS X or a browser like Safari or Firefox, and then write an exploit.

So how do Macs get infected with things like MacDefender?

Easy, they dupe users into doing the job for them. This video shows how the Mac scareware scam works. (Video: Intego.) The group behind MacDefender entices victims to malicious sites, where a Web page that looks like the Mac Finder appears, runs a phony virus scan, then claims that the machine is infected with dozens of Trojans. When the unsuspecting user clicks the "OK" button, MacDefender downloads to the Mac. Such social engineering-style attacks are commonplace on Windows, but have been rare on Macs. Looks like that party is over. Okay, so I fell for the ruse. What happens next?

Once it's downloaded, MacDefender automatically pops up an install screen on Macs where Safari is running.

How to transfer music from ipod to computer
and

how to transfer music from ipod to ipod are
common problems for most users.

If you used another browser to download the scareware -- Firefox or Chrome, for instance -- the criminals rely on you to find the just-obtained installation package in the browser's download destination and click on it. Next you'll see a typical Mac installation process. (In earlier versions you had to enter your administrator password, but that requirement's been eliminated in the most recent version, dubbed "MacGuard.") Once MacDefender's fooled you into installing it, the scareware runs another scan and drops numerous alerts on the screen, all part of the scam to make you think your Mac is infected. To remove the "infections," you have to pay up by entering your credit card information. I'm not completely stupid ... I just won't pay up. What happens then? MacDefender -- which also goes by names like MacSecurity, MacProtector and now, MacGuard -- duns you with those irritating pop ups, flashes an icon in the menu bar, and worst of all, opens pornographic pages in your browser every few minutes.

That last is a new twist to spur you to pay for the scareware. "We think they're doing this because most people will assume that that means they've got a virus on their Mac, and they need to get rid of it by paying for the program," said Peter James of Mac-only security software maker Intego in an interview earlier

this month. MacDefender automatically runs each time you start your Mac, so you can't get rid of it by restarting or shutting down the machine. So it's here to stay? Isn't there a way to get rid of it? Yes, you can scrub your Mac manually. Earlier this week, Apple finally acknowledged the MacDefender scareware campaign by posting a support document on its site. That document spells out the removal steps you should take.

How to share music between ipods, know more about zune vs ipod touch is a necessary thing.

Can't the Mac remove this itself? Not yet. But Apple's promised an update to Mac OS X 10.6, aka Snow Leopard, that will. "In the coming days, Apple will deliver a Mac OS X software update that will automatically find and remove MacDefender malware and its known variants." Apple said in the support document it published Tuesday. "The update will also help protect users by providing an explicit warning if they download this malware." Only Snow Leopard has rudimentary antivirus capabilities, which can warn users of a small number of threats. That same feature can also quarantine already-downloaded files that it deems dangerous. But Apple seems to be saying that it will add a cleaning tool to Snow Leopard that can scrub an already infected Mac. If so, that would be a first. And it would mean that Apple would be following in the footsteps of Microsoft, which has offered free cleaning tools -- notably the Malicious Software Removal Tool, or MSRT -- for years. MSFT is updated at least once each month, then pushed to customers via the Windows Update service.

People running older versions of Mac OS X, including 10.5, aka Leopard and 10.4, the even older Tiger, presumably will be on their own.

Functional accessories are good partners for your ipad It can be said Apple era now, we all don't know how popular Apple products are and almost everyone all over the world is paying attention to Apple news and information. We can easily hear it in our daily life. One of great benefits of the iPad is that you can take it with you anywhere you go: to the office, to a coffee shop,

or on a cross-country flight. But chances are, you use it just as much at home, lounging, snug and cozy, on the couch or in bed. And you've probably found yourself trying to figure out the best way to keep it steady-propping it up on your legs, holding it in your (eventually tired) hands, and so on. If you've ever wondered if there was a better way to position your device on your lap, sit back and relax-a number of accessory vendors have come to your aid, offering ways to ensure your iPad and your lap have as wonderful a relationship at home as you and your iPad do on the road. (All products are compatible with both the original iPad and the iPad 2; only the Padprop has different models for each.)

ipod to mac transfer and ipod transfer are perfect tools for Apple ipod users, they can bring us so much.

PadProp

Looking a bit like a black-foam profile of a Texas longhorn skull, Prop-It Limited's £15 PadProp is a compact iPad holder that feels sturdy and keeps the tablet in the middle of your lap. The PadProp's unique shape allows you to wedge it in the dip between your legs while sitting, keeping your iPad secure while using your device. Typing on the iPad feels great, as the PadProp leaves the screen completely unobstructed and keeps the iPad stable. On the back of the PadProp is a holder for Apple's earbuds, in case you take the holder with you on the go. The PadProp is available in a variety of colors, such as black, neon green, or pink.

While the PadProp works well, it forces you to keep your legs close together to ensure your iPad and holder don't fall or sink. The PadProp was also hard to slip on and off, sometimes requiring some muscle to remove it, and doesn't work with the tablet in portrait mode. The holder works best as a flat surface viewer, allowing you to place the iPad at various angles for viewing by moving the holder up or down.

ePillow

As its name implies, Veyl Products' \$30 ePillow () is essentially a long, polyester cushion with three vinyl-covered "bumpers" sewn into the body to hold the iPad securely, along with a pocket on the right-hand side to provide a place to store smaller accessories like earbuds or a dock-connector cable. The best thing about the cushion is that it's very comfortable on your lap and soft to the touch, making you almost forget you're using it. It

holds the iPad firmly within its bumpers in landscape orientation. (You can also place the tablet on the ePillow in portrait orientation-I was surprised that my iPad didn't tilt back in portrait mode, but as long as the bottom edge of the iPad is tucked under the lower bumper, it's stable.) Many ipod users have these problems:

How to transfer music from ipod to computer
and
How to Transfer Photos from iPad to Computer,
maybe i can give you some good suggestion.

Though the ePillow is comfortable, it does make it a challenge to use the iPad's onscreen keyboard, since the bottom bumper is thick enough that it gets in the way of the lower edge of the tablet. (This is especially an issue if the iPad is in portrait orientation, as when you pull the bottom edge of the tablet out from the bumper for better access to the onscreen keyboard, the iPad tends to tilt backward.) Despite this limitation, the ePillow makes for a very good lap companion, and it's available in either brown or black.

PropUp

One thing that can be said about PropUp LLC's \$30 PropUp () is that it's eye-catching. It looks like a rectangular, foam, turtle shell with the company's logo on top and grooves underneath. When you turn the PropUp upside-down, the iPad slips right into four corner "claws," securing the tablet in place even when you flip it over. (Despite this firm grip, removal is quite easy, allowing the accessory to slip right off when you're done.) The PropUp's curved back feels comfortable on your lap-it rests nicely in the groove between your legs-and the PropUp doesn't get in the way while typing on the iPad's onscreen keyboard.

The company claims the PropUp can also be used as a desktop stand, but while the PropUp works great on a flat surface with the iPad in landscape orientation, when I tried to view the iPad's screen in portrait mode, the entire contraption tipped back. The PropUp also occasionally turns off the iPad, since the holder's wraparound corners can accidentally hit the iPad's Sleep/Wake button. Don't you want to

You can easily get the best answers from me,

WedgePad R1

There are many bean bags on the market, all with a variety of purposes, but the black and white WedgePad is essentially an iPad-sized beanbag designed to hold your tablet on your lap or any other surface. The wedge-shaped WedgePad sports four elastic bands, one on each front corner, that hold your iPad in place. The accessory's light weight and compact design make it easy to carry around with you, and it can be used in both landscape and portrait orientation while on your lap, though, like some of the other products covered here, requires you to keep your knees together so the WedgePad doesn't fall between your legs. The bean bag can also be used on a flat surface for 30- and 45-degree viewing (you choose the angle by the direction the WedgePad faces), but only when kept horizontal.

Powerful and useful iPad apps are so popular now

iPad is a consumer product for fun and reading. The tens of thousands of programs in AppStore can provide more applications to the iPad and entertaining way. iPad without PhotoShop is not surprisingly, the various software applications in many aspects of graphic production methods to iPad, and better than in real computer systems more convenient and gorgeous. Apple's iPad is a powerful and versatile creation tool that allows artists to use their tablets as portable art studios. Here's a rundown of some of the best art apps available for the iPad today.

When Apple first unveiled the iPad to the world, it was categorized as nothing more than a glorified media consumption device. Yet in the months that followed, app developers and creative users proved that the Apple tablet could also be a powerful and versatile creation tool. A little more than a year later, artists are using their iPads as portable art studios for everything from sketching ideas to painting digital masterpieces. But if you are new to finger painting-or digital art in general-it may be difficult to figure out how to proceed. So in the spirit of getting started, let's simplify the process of creating artwork on the iPad with a rundown of some of the best iPad artwork apps available today.

Adobe Eazel: Adobe Eazel for Photoshop is Adobe's first attempt at a painting app, and an exciting demonstration of how the iPad can be used in conjunction with desktop software. Eazel features an interesting liquid-paint simulation, which can

produce natural looking, loose paint work. Adobe has implemented a unique five-finger interface for Eazel, which literally places its tools at your fingertips. This simplified interface is fun to use, but can be irritating at times, as it requires a certain degree of dexterity to navigate successfully. As an extension of Adobe Photoshop CS5, Eazel is worth a look, but as a standalone painting application, this version lacks basic features such as brush choices and layers.

Inkpad: So far, all of the apps mentioned are intended for artists who like to sketch and paint, but recently Steve Sprang/Taptrix, the developers of Brushes, released a new app called Inkpad, which is a full blown vector illustration app. Using your fingers you can tap and plot Bézier curves with the pen tool, draw geometric shapes, and make path adjustments as you work. Inkpad has an incredible depth of functionality with a well-thought-out user interface. There is a floating toolbar for the main toolset and pop-up menus for layers, color swatches, and path adjustments. Overall, Inkpad is a brilliantly executed iPad app and a mouth-watering prospect for any vector artist.

ArtStudio: Lucky Clan's ArtStudio for iPad brings some of the best features from across a range of painting apps into one place and is probably the most desktop-like app that I have used on the iPad. It has a broad array of brushes including an airbrush, wet brush, and a useful scatter brush for creating patterns and textures. There are hidden panels of options for brushes, colors, and layers that give you extra choices, when needed. A great feature of ArtStudio is its filter panel for making stylized adjustments to your painting, such as Gaussian blur, sharpen, noise, and colorize. Unfortunately, the user interface suffers because of the number of tools available. Despite that, I found ArtStudio a quick app to navigate and easy to get used to working with.

If you are new to iPad finger painting or digital painting in general, Brushes and Procreate are by far the easiest apps to learn. They both have really clean interfaces and don't overly complicate the process with too many settings. ArtStudio or SketchBook Pro may be better choices for more experienced users who are looking for an app with the same amount of options as a desktop package, while ArtRage is the obvious choice for artists looking to achieve a natural quality in their work.

There is no perfect iPad art app. Each has its own strengths and weaknesses-I often work with several different apps to complete a single piece of artwork. I consider Brushes to be my main iPad art app because it offers a good balance of features and usability with the option to playback and export your steps later. For me, that is a killer feature.

iPad, we can clearly foresee in the future it will be even greater prospects for development. Look forward more surprises and happiness iPad can bring to people.

Take attention to top free iPhone and iPad Apps

iPad can run nearly 20 million apps in App Store, from games to business applications, are all available. iPad specially developed for the new procedures were particularly marked, and you can see at a glance. It all just needs click iPad App Store icon on the screen to complete, open the browser after you can select your favorite program to download.

They're new, they're fun, they're useful and best of all, they're free - Here are 7 iOS apps for work and play. Are you done playing all the levels in Angry Birds and looking for some other free cool apps to try out? I've selected my top 7 from dozens of great new apps for your iPhone or iPad launched this year - and here's the best bit: they're all free. apps are one of the most exciting areas of innovation in technology today, with the tablets and smartphones that use them in the hands of millions. Here's a look at some of the apps for Apple's iOS and Google's Android that have the potential to improve our day-to-day lives (or at least make them more bearable and entertaining). Let's get started.

Google Places: This app gives you access to Google's directory of restaurants, cafes, bars, and other venues worldwide, and can help you find great spots around you.

Bing for iPad: A sleek combination between search engine and magazine-like aggregator, the Bing for iPad app is a great way to leisurely flick through news, movies, or even popular searches.

MTV Music Meter: MTV's Music Meter app lets you discover new music with a daily list of trending artists. You can then sample related artists, photos, news articles, and even their tweets.

Photosynth: Capture the world around you with your iPhone in spectacular 3D panoramas. Microsoft's app stitches your pictures together and you can share them via Photosynth's online service or on Facebook with your friends.

Frisbee Forever: Flick the Frisbee, steer through obstacles, and collect stars. A simple, delightful, and entertaining game, Frisbee Forever is one of the latest must-have apps for both iPhone and iPad.

Opera Mini 6: Great for when you are on a slow connection, Opera Mini 6 for iPhone and iPad is a serious contender to Safari. Background tab loading is a great feature and you can synchronize bookmarks from your desktop computer if you use Opera as your browser.

Nike+ GPS: Nike's running companion app is currently free and you don't need the special shoe sensors to use it - it records your running routine via the iPhone GPS and accelerometer. iPad is indeed a fun read for the consumer product. AppStore in the tens of thousands of programs can provide more applications to the iPad and entertaining way. iPad no PhotoShop Not surprisingly, the various software applications in many aspects of graphic production methods to iPad, and better than in real computer systems more convenient and gorgeous.

Four essential mobile apps bring us a happy summer vacation

Summer vacation can give us the enjoyment of the mind, make your own thinking, feeling developed to excited, happy in the extreme.

Everyone feels a lot of pressure in daily busy life, it is necessary in a number of holidays to relax, enjoy the sun, sand, sea, blue sky, white clouds. With these essential apps, you can avoid road rage, bedbug-infested cabin fever, and other travel maladies while maximizing your relaxation time.

Travel can be torture, but if you arm yourself with these mobile apps and websites for getting the most out of your vacation, you can steer clear of the tourist traps, stay one step ahead of the crowds, and make your flight with time to spare.

Gogobot

Web: www.gogobot.com

Apps: None

Gogobot takes travel recommendations to the next level by integrating with Facebook, FourSquare, and Twitter. The service, which is still in beta, differs from your run-of-the-mill travel site in reaching out to your social network of friends for their recommendations and travel tips. After signing up for a free account you can connect with any mutual Facebook or FourSquare friends who have also signed up for Gogobot. Looking for a place to stay in Boston? Gogobot will single out recommendations that your friends have made in Boston along with all the other Gogobot users. Because Gogobot is integrated with Facebook, FourSquare, and Twitter, you can address a question to a social network. Gogobot will take a question such as "Know a great place to eat in Boston's North End?" and automatically post it to Facebook, culling the results and getting back to you within the Gogobot service.

Poynt

Web: None

Apps: iOS, Android, Windows Phone 7, Nokia, BlackBerry Smartphone, Tablet and Enterprise Server (free)

An easy-to-use, GPS-enabled app, Poynt allows you to find businesses, people, movies, restaurants, and gas stations close to your current location. When you enter the name of a business, its address and phone number pop up, along with a map and an opportunity to have the map and the information sent to your phone. Poynt's movie feature includes trailers, reviews, theater locations, and film start times, as well as a top-ten film listing.

Poynt comes in numerous app flavors, including a version for the otherwise app-starved BlackBerry PlayBook tablet.

Yelp

Web: www.yelp.com Mobile: <http://m.yelp.com>

Apps: iOS, Android, BlackBerry, Windows Phone 7, Palm Pre (free)

It's technically not a travel site, but Yelp offers huge archives of user-generated reviews covering everything from five-star restaurants to corner food carts. The data is an invaluable for travelers who want to avoid substandard hotel rooms, bad food, uncomfortable airline terminals, and the like, as well as to find local treasures that might not make it into any tourist guide. During a trip to Chicago that I took recently, Yelp yielded numerous tips that the best burger in town was sizzling a block from my Loop hotel. And so it was. As with TripAdvisor, though most of the advice is genuine, Yelp does get some planted commendations and complaints from people who have ulterior motives.

FlightBoard

Web: none

Apps: iOS, Android

Simplicity is the key to FlightBoard from Mobiata: The app has the look and feel of one of those low-tech airport monitors that track arriving and departing flights. But when you click on your flight, a handsome window opens showing such flight particulars as delays and gate information. According to Mobiata, the app offers data for 1400 airlines at 4000 airports worldwide. The service refreshes its data every 5 minutes, and you can share flight information in a few steps via Facebook, Twitter, text message, or e-mail.

Just to be yourself, enjoy more from leisure time.

It is a better choice to transfer music from ipod to computer

Easy free way for how to transfer music from ipod to your computer. This method is same for all type of ipod whether it is ipod nano, touch or shuffle to copy music. This article can help users to transfer music from ipod to computer.

iPodClassic There are perfectly legal reason for wanting to do this, however. What if your hard drive crashes? The music might be gone from the computer, but it still exists on your iPod.

Grabbing it off the iPod would be a simple solution, and would save a lot of time and money, but Apple won't let you do it.

There are dozens of third party solutions that will copy the music off your iPod. Some are free, but most cost ten or twenty bucks, maybe more.

I'm sure the third party software works fine and does the job wonderfully. It is a well established fact that Apple have created an absolute gem in music player. The Apple has taken the mp3 player market by storm and wiped out most of its competitors.

Many people like Apple iPod for its delicate appearance and outstanding quality. However, there is a problem in front of users. There are many people who have used iPods for years, but they do not know how to transfer music from iPod to Computer.

Although it is very easy to copy music or files from computer to iPod, but it is not so convenient to transfer music or files from iPod to computer and thus Apple plays its part in reducing the chances of piracy. But it's not like it cannot be done.

Now, you can legitimately transfer music from iPod to computer with - iPod to Computer Transfer. This iPod Transfer software is an easy tool designed to help you back up all your files from your iPod, iPhone, iPad or iPod Touch, so that you can recover any lost or missing music. With this package, you can transfer all of your iPod, iPhone, iPad or iPod Touch content (including your favorite music, videos, photos, play lists and more) easily and efficiently.

Free download. Then do as the guide tells you step by step.

It is such a right choice to jailbreak your iPhone

iPhone usage has been very high now, the influx of people in various fashion, celebrities, high penetration rate among higher.

It is defined as a symbol of good taste. iPhone is undoubtedly a very great across ages, and some even play the slogan of "the iPhone can do anything". There is still not a cell phone in the user experience beyond the iPhone! Currently the software on the APP store has reached hundreds of thousands, the world's super-billion cumulative downloads.

Jailbreaking your iPhone has never been simpler with the latest release of JailbreakMe. Instead of the previous method of hacking into the iPhone through your PC, JailbreakMe.com exploits a flaw in the Safari Web browser's PDF viewer that grants instantaneous freedom from Apple's notoriously locked-down

policies. Even before jailbreakme, jailbreaking iPhones was a popular practice with many benefits -- and many downsides. Here's are 5 reasons why you should consider jailbreaking your iPhone with jailbreakme -- and 5 reasons to avoid it.

Reasons why you need to jailbreak your iPhone:

Cool Jailbroken iPhone Apps

Apple's legit App Store has many cool offerings, but jailbroken iPhones have a wide array of banned creative and quirky apps. Access to Cydia -- the hub of "illegitimate" apps -- is a huge motivation for jailbreaking your iPhone. There are many lists of great jailbreak apps to check out -- here are a few standouts:

MyWi: Turns phones into mobile hotspots

Intelliscreen: Puts e-mail and calendars

on the home screen

MxTube: Download YouTube videos onto your phone for offline viewing

My3G: Allows for previously Wi-Fi-only processes to run on 3G, like HD YouTube videos

PDANet: Share Internet connection

Access to T-Mobile GSM Network

The biggest problem with the iPhone is not the "death grip" that blocks your mobile signal -- it's AT&T. AT&T has exclusive rights over the iPhone until at least 2012, and with all of the network's problems -- mostly related to its tendency to drop calls -- many are justifiably wary of purchasing a phone tied to a problematic network. But the latest jailbreak gives users access to T-Mobile's GSM network, which works overseas and may be more robust in your area.

FaceTime Video Chat over 3G

FaceTime video chat is a nifty new feature of the iPhone 4, but it only works over a Wi-Fi network, which may be difficult to find in many situations. Jailbreaking the iPhone 4 allows for FaceTime video chat over a 3G connection. The results are less-than-pretty, but it's more convenient and won't be interrupted if you have a good signal or walk out of Wi-Fi range.

Fully Reversible

If you're scared of the consequences of jailbreaking your iPhone -- or simply don't like the experience -- jailbreakme is fully reversible. According to jailbreakme.com, "If you ever decide that you want to remove your jailbreak, just connect your device to

your computer, sync, and then press Restore in iTunes." Beware: if you upgrade past iOS version 4.0.1, there may be some unknown outcomes.

Fast and Easy

One of the best parts about jailbreakme is how quick and easy it is to open up your iPhone. No need to download software onto your desktop or hunt for updates that dodge jailbreak-killing iTunes updates -- by using the Web browser, the whole process takes less than a few minutes over a Wi-Fi connection. Still, you can expect Apple to release a patch that will shut jailbreakme down at least temporarily.

So what's heavier to you -- the pros or the cons? Are you planning to utilize jailbreakme to get the most out of your iPhone? Or are you content with the features the iPhone already brings to the table?

There are 3 essential ways to enjoy your iPad

Since the last year, iPad is obvious the hottest commodity, this is what some have called "the devil's toy design," triggered an unprecedented discussion and pursuit of the consumer and other products for the continuing iPad2 crazy occasion, it quietly changed people's live, work patterns and relationships.

Did you know that you can stream movies from your PC to the

iPad, use it as a secondary monitor, connect USB speakers and keyboards, and browse Web sites with actual tabs? Here's how to get the most from Apple's iPad. The iPad is loaded with all kinds of features you've probably heard about, but look a little deeper, and its extra abilities might surprise you. Some of these secrets are enabled through apps, while some are built into the device already.

Connect More Than a Camera

Apple's iPad Camera Connection Kit does so much more than its stated purpose. Instead of just transferring photos and videos from your camera or SD card, the adapter's USB port attaches a range of devices. Many USB keyboards work. The iPad presents a warning that the device isn't supported (shown left), but if it doesn't draw much power, you can ignore the message. Volume and media keys usually work, and you can even use desktop commands such as Command-Z. (Don't forget that the iPad also officially supports Bluetooth keyboards and Apple's iPad Keyboard Dock). USB audio devices can work, too--including speakers, headsets, and microphones. If a device draws too much power and balks (as when I connected a Zoom H2 mic and Logitech V20 PC speakers), no problem: just attach the device to a powered USB hub, and connect the hub to the Camera Connection Kit adapter. You can even attach different devices--such as a keyboard and speaker set--at the same time.

Jailbreak for More Features

Apple maintains obsessive control over the iPad, making it less like a computer and more like a media player. But you have an alternative: Jailbreak the iPad, and you can run third-party apps that weren't approved by Apple.

If you're willing to jailbreak your iPad (which means voiding your iPad warranty and taking full responsibility for anything that may go wrong), then you can also use the Camera Connection Kit to read USB sticks and SD card directories. (Without jailbreaking, you can already import SD-card videos and photos or attach a Compact Flash reader). With a bit more fiddling, you can read files from an external USB hard drive. Those are a lot of unnecessary hoops to jump through for such basic connectivity, but it is at least possible. Again, jailbreaking is best left for the tech-oriented or the adventurous.

You would connect the iPad to a computer, run Sprit and then be able to install apps through the Cydia interface. Cydia and iTunes apps coexist, so you can install apps like Backgrounder and Multiflow to enable multitasking (letting you listen to Pandora while working in other iTunes-purchased apps, say). Of course, multitasking is coming officially in OS 4.0. Notes: ProSwitcher (arguably the best jailbreak multitasking app for the

iPhone) didn't appear to be optimized for the iPad (yet) at the time of writing. For jailbreak apps, sticking to those that have been reworked for the iPad will help avoid--though not guarantee against--unnecessary hassle.

Other jailbreak apps include iPad-ready versions of Wi-Fi Sync (wireless iTunes syncing), Winterboard (customized themes), and Dashboard (OS X-style widgets). You can also use your iPad with a mouse, run game console emulators and hand controllers, and otherwise do things Apple doesn't allow. Benefits will grow as the iPad jailbreaking community expands.

Turn Your iPad into a Secondary Desktop Display

With its big, high-resolution display, it's a shame to just park an iPad when switching to a computer. Instead, Air Display (\$10) makes your iPad a second screen for your Mac, extending the desktop. The tool has just been submitted to the App Store and should be released soon; I checked out a beta.

You install a utility on the computer and connect with the Air Display System Preference. (It's Mac-only at launch, but a Windows version is coming.) The iPad then behaves just like an extra screen. You reposition it in the Displays System Preference like a real monitor, in a portrait or landscape view. Although it lags a little when showing video, it refreshes quickly enough for most work. You can even tap on the iPad to click.

The latest Firefox 5 will be a good partner for users

After the wildly successful launch of Firefox 4 not all that long ago, it's hard to believe the next iteration of Mozilla's popular and free open source browser is already here. Mozilla today delivered the final version of Firefox 5, the first edition under the new faster-release regime it kicked off earlier this year.

The company also patched 10 bugs in Firefox 5, including one in the browser's handling of the WebGL 3-D rendering standard that rival Microsoft has called unsafe.

Shortly after Mozilla launched Firefox 4 in March, the company committed to a faster release schedule that puts the browser on a six-week refresh cycle that lets developers add features as they're completed, rather than hold them until all work on the next upgrade is completed. If a feature presents problems, it's yanked and re-inserted into a later cycle after fixes have been applied. Mozilla has denied copying Google Chrome's upbeat schedule -- that browser was the first to institute a fast-release strategy -- but analysts have noted the similarities and pointed out the need of all browser makers to step up the pace.

Firefox 5's user interface is nearly identical to Firefox 4,

for instance. Mozilla also dropped a feature it had touted during the testing phase, dumping a tool that let users change development channels from, say, the final to either Beta or Aurora, rougher builds that precede the most stable edition. The company decided that few were using the channel switcher, and rather than devote time and resources to maintaining the feature, pulled it.

1. It Respects Your Privacy

Mozilla's Do Not Track feature gives users more control over the way their browsing behavior is tracked and used on the Web by allowing them to tell the websites they visit that they want to opt out of online behavioral tracking. Now, in Firefox 5, Do Not Track is even easier to find in the Firefox Preferences section. Also of note is that Firefox 5 for Android includes the Do Not Track feature as well, making Firefox the first browser to support Do Not Track on multiple platforms, Mozilla says.

2. It's Small and Fast

I've been feeling like Firefox 5 is faster, and that impression was recently confirmed over at Digitzor, which ran it through a bunch of benchmarks. Firefox actually blew away both Chrome and Opera on the SunSpider JavaScript test, in particular (no other browsers were included), and its cold start time compared very well with that of Google's Chrome. Firefox 5 was also notable for taking up minimal RAM, even with 25 websites opened.

3. It Supports an Open Web

With improved standards support for HTML5, XHR, MathML, SMIL and canvas, Firefox 5 is the best browser choice for an open Web. The new Firefox Add-on SDK for Windows, Mac and Linux enables local development of add-ons, meanwhile, and the Firefox Add-on Builder Beta provides a hosted Web-based build environment. The new version of the multiplatform software also adds support for CSS animations.

4. It Sports 1000 Improvements

It's actually more than 1000 improvements and performance enhancements that have been included in Firefox 5. They may not all be huge, noticeable user-interface changes, but they definitely make the software better. The Android version of Firefox 5, meanwhile, includes a raft of bug fixes, improved page load speeds--especially on 3G networks--and added IPv6 support.

5. It's Secure, Independent and User-Driven

Firefox is open source software, which means it's not only developed with the help of users, but its security is continuously monitored and improved by a global community of users and developers. Mozilla, meanwhile, is an independent foundation. There's no way a proprietary browser maker like Microsoft -- or even a company like Google, which has its fingers everywhere -- can compete with that independence and user focus.

Firefox clearly faces stiff competition from Google's Chrome, but further improvements are on the way in Firefox 6 and beyond. You can download it here and see for yourself.

Five important unique features Android has

iPhone introduced a new user interface that based on a large multi-touch display and pioneering new software, allowing users to use fingers to control iPhone. iPhone also ushers in mobile devices, a new era of software power and sophistication, to redefine the mobile phone functions. iOS by Apple for the iPhone operating system. It is to the iPhone, iPod touch and iPad use. As its based on Mac OS X operating system, as it is based in Darwin. As with past iPhone updates, iOS 5 plays catch-up with Apple's competitors and Android in particular, while adding unique features such as Twitter integration, iMessage, and online storage through iCloud. But is that enough to solidify the iPhone's standing as the best smartphone around? Not necessarily. Android still has several features that the iPhone lacks, and may still be worth considering if these features are important to you:

Widgets

Android widgets can show certain types of information directly on the home screen, such as breaking news, sports scores, incoming messages, or media playback controls. In fairness, a lot of Android widgets add unnecessary clutter to the phone, but if you can find the right widgets for you, they'll either save time or present information that you might've otherwise overlooked.

Hardware choices

Software features aside, Android provides more hardware choices for phone buyers, including handsets with bigger screens, physical keyboards or features not yet available on the iPhone, such as dual-core processors. The iPhone 4's hardware is excellent, but it may not be the perfect fit for you.

iPod to Mac Transfer is

specially designed for Mac user to transfer iPod files, It can fast transfer, rip, copy and manage your music, video, photo, podcast and TV program from iPod to Mac, iPod to iTunes, iPod to iPod and Mac to iPod transfer is also available.

Expanded voice commands

The rumor of expanded voice commands in iOS5 didn't pan out, so for now, Android provides more voice command options that are built directly into the operating system. Android users can dictate e-mails and text messages and get directions by speaking to the phone. They can also load music in third-party apps such as Pandora with the "listen to" command, whereas the iPhone's music-by-voice feature is only linked to the iPod app. We tested many of ePub DRM removal

software in the market, compare them from stability, speed, safety, price, and more, then we find the best ePub DRM removal tool. It's wonderful and professional to remove ePub DRM, remove DRM protections from adobe digital editions with high quality.

GPS Navigation

Android phones have offered free, voice-guided GPS since October 2009, whereas the iPhone's Maps app requires users to look at their handsets and read off directions as they drive. The iPhone has third-party apps with turn-by-turn voice guidance, such as Mapquest, but Android's built-in method allows users to jump directly into navigation from address links in other apps. With the iPhone, you must manually copy and paste the address into your app of choice.

Setting Default Apps

The iPhone's lack of native GPS navigation wouldn't be an issue if you could set third-party apps as the default for certain functions. On Android, if you want to use alternative apps for mail, Web browsing or navigation, you can set those apps as the default for all related functions. For instance, setting Dolphin HD as the default Web browser opens all links from other apps in Dolphin instead of the stock Android browser. It's a subtle feature that makes customization much easier on Android compared to the iPhone.

iPhone 5 will be the most popular product in 2011

iPhone5 will no doubt become the most noteworthy of 2011 smart phone. iPhone debut before each generation are covered with a layer of mystery, the time to market, what's the price, and so on.

Apple reinvented the mobile phone, and revolutionized the smartphone when it introduced the iPhone. It has been surpassed in overall market share by the me-too, copycat Android OS, and Microsoft's Windows Phone 7 is a worthy challenger as well, but this fall Apple has an opportunity to set the bar for the industry once again, and leave the competition in the dust with the iPhone 5.

1. iOS 5. Apple has already shared with us the details of iOS

5. The new iOS will finally free the iPhone (and

iPad) from the PC-syncing and updating

wirelessly instead of requiring a physical connection to a USB

port. The improvements in the iOS mail client, the addition of

iMessage, tabbed browsing in the default Safari browser, and the

behavior of the Notification Center will all contribute to the

success of the iPhone 5.

2. iCloud. Along with iOS 5, Apple will also officially launch

iCloud around the same time the iPhone 5 is expected. iCloud will

enable effortless, seamless syncing of email, files, music,

contacts, calendars, and other content between the iPhone,

iPad, and Windows or Mac PCs.

3. Verizon (et al). The iPhone 5 will be the first new iPhone

model introduced since the exclusivity with AT&T ended (no,

the white iPhone does not count-not even a little). The Verizon

iPhone 4 has been a huge success anyway, but many Verizon

customers held off knowing that a new iPhone is just around the

corner, and not wanting to be shackled to an iPhone 4 with 18

months left on the contract. The new unlocked iPhones will make a

difference as well.

Transfer

Music from ipod to Computer is the same problem for many

ipod users.

Apple iPhone 5 Details are scarce, but even from what little we know, the iPhone 5 could revolutionize smartphones...again.

4. The

Camera. The smartphone is quickly replacing the point and shoot, and emerging as the camera of choice for most consumers. It has already put the nail in the coffin of the Flip video camera. But, there is more to digital photos than maxing the megapixels, and most smartphone cameras take inferior quality photos. Speculation suggests that the iPhone 5 will have an 8 megapixel camera, with dual-LED flash for better low-light photography, and that the iPhone 5 camera will set the bar for smartphone photos.

You can easily get the best way to transfer

music from ipod to

ipod, learn more from here.

Some of this is based on speculation-we don't really know what the

camera functionality or hardware specs will be

just yet. But, just the things we already know for a fact are

enough to make the iPhone 5 the king of the hill and leave all smartphone competitors playing catch-up.

5. The Specs. The iPhone 5 is expected to (or rumored depending on your perspective) to use the same dual-core A5 processor Apple uses in the

iPad 2. The processor really just plays catch up

to the status quo rather than blowing rival smartphones away, but Apple somehow squeezes better performance and a superior experience out of equivalent, or even inferior hardware.

Many people still believe that iPhone 5 will be the king and

it always can bring us more surprises and it allows us easily to

enjoy more and people are glad to benefit more from the Apple.

Let's look forward the coming of iPhone 5.

Functional iPhone apps are good partners for users

More and more people become iPhone users, all of these person want to perfectly use their iPhone to enjoy the most. Are you looking for the best iPhone apps? Here are our top picks, from social networking tools to entertainment programs.

Whether you're a longtime iPhone user or the proud owner of a new iPhone 4, you know that great apps are the key to taking full advantage of your handset. Our package of essentials should be more than enough to get you started. In this article, you can easily see the top software for your iPhones; if you have a different mobile OS, be sure to see our picks for Android, BlackBerry, or Windows Phone 7.

You can easily find these apps by searching in the App Store. You'll need to have an account there, and the apps may cost a dollar or two. Before you buy, read the minimum requirements for each app to confirm that it will run on your phone. Remember that downloading apps counts against your monthly data-usage limit. And for the latest reviews, be sure to visit the iPhone AppGuide.

Video and Photo

Instagram Half photo editor, half social network, Instagram

allows you to add artsy filters--for instance, a hazy atmosphere or a green tint--to your pics. You can also check the Instagram feed and see what photos your friends have been snapping lately. Thumbs Edit photos using effects, filters, adjustments, and borders. This app has more options than you'll likely ever use, so doctoring photos becomes as much of an art as taking them. Viddy Our sister publication Macworld calls Viddy the "Instagram for video" because it lets you add your own filters and effects to video that you shoot on your iPhone. The ability to connect with other Viddy users and watch their creations makes this the best mobile video-editing app, period.

Social Networking

The easy-to-use Beluga group text service allows friends to join conversations, coordinate activities, and update their locations on a map, making this app a perfect tool for organizing group gatherings in new places. Have tons of friends? Do they all use different instant messaging services? No problem: Imo eliminates the hassle by allowing you to sign in to the most popular instant messengers all at the same time.

Users check in at locations, and can post questions such as "How much are museum tickets?" Other users in the know then answer in real time. Currently Loopt covers only big cities.

Productivity and Security

More powerful guides you can see from here, such as how to transfer music from ipod to computer, how to transfer music from ipod to ipod, how to restore iPod without iTunes and so on. epub drm removal and ebook drm removal are essential powerful tool for uses, just take more attention and spend a little time on it.If you use Dropbox on your desktop PC, you already know that it's the easiest way to sync files across multiple systems. With Dropbox for your mobile device, you can quickly move files from your PC to your phone without having to plug your handset into the computer. Apple recently made this useful app free for all iPhone/iPod/iPad users. The easiest way to track down your lost or stolen handset, Find My iPhone shows the device's approximate location on a map. With Springpad you can create to-do lists, and set reminders for yourself to increase your productivity. In addition, you can "bookmark" books, movies, or other items that have yet to be released so that you can remember to buy them later.

Weather

AccuWeather Unlike the Weather Channel app, AccuWeather lets

you manually refresh the screen to update weather data on demand. The app also boasts a GPS feature that permits you to check the forecast for a spot on the map that you don't have a name for--very practical if you are out traveling or camping. MyRadar Pro This gorgeous app for map nerds shows color-coded weather patterns in 10-minute intervals, so you can see how quickly systems are moving. It's especially useful for outdoor types and budding meteorologists. WeatherBug Elite Look to this app for local meteorological stats such as temperature, humidity, barometric pressure, and wind speed. It also provides radar maps, pollen conditions, and forecast videos. Weather Channel The most trusted name in weather updates has an easy-to-use app. Weather news refreshes every time you move between screens, and weather tips and trivia can help you pass the time if you happen to be caught in a storm.

Kindle and epub exchange

We
knew that kindle is for amazon, epub is for ipad.

Recently
I heard about that they can change to each other, that's a good
news.

But
the fact is no.

Well,
the new Kindle format that we discovered yesterday is a pretty good sign that Epub just isn't going to happen.

Amazon
just released Kindle print replica (KPR), and it has a lot of details in common with a PDF. KPR is a fixed layout ebook format like PDF and it even uses a similar tool bar.

Here's
the thing. Amazon didn't adopt PDF. They could have used PDFs if they wanted to, but instead they went with their own proprietary format. They went with something that was like PDF but that they could control completely.

This
new format should tell you a lot about Amazon. They value control over usability. It should also tell you that Amazon's future plans probably won't include any open formats.

If
Amazon ever do adopt Epub, I'd bet that they will call it something else. I also suspect that Amazon Epub format will not be wrapped in a Zip file (like the Epub standard requires). Breaking with the open standard is how they control their platform.

There
are two ways to change the reality:

Wait

or

use ebook converter or

something like that, firs need to
