Breast Augmentation Los Angeles?? Getting Fuller Natural Looking Breasts

Breast augmentation is a cosmetic procedure that may enlarge a woman's breasts by using implants. The implants may be inserted by the surgeon to enhance the figure, making the breasts to appear larger and fuller. During the consultation with the surgeon, the patient may be given an overview of the procedure, the pros and cons of the technique, potential risks and complications, recovery course, pre- and post-operative instructions and aesthetic outcomes. Patients may also be asked to try both saline and silicone implants to see which is suitable for them.

Usually,

breast augmentation Beverly Hills is performed for

- Small breasts- Breasts are considered to be vital assets for women and those having smaller breasts may feel inadequate or unwomanly. This may make them feel low in confidence and have low self-esteem.
- Pregnancy and Breastfeeding- Pregnancy and breastfeeding may cause the breasts to lose volume and sag. This condition can get frustrating if it is not helped by exercise and firming creams. This may leave women asking for youthful and fuller breasts.
- Weight loss- Women undergoing weight loss programs may feel their breasts losing in volume and size.
- Asymmetrical breasts- Typically, women with breast asymmetry are born with this condition. However, it may get prominent due to pregnancy. Sometimes, asymmetrical breasts may also be caused by Poland's

Syndrome.

- Aging breasts- Age may take a toll on breasts causing them to lose breast tissues.
- Sagging of breasts- Sagging breasts can be fixed with the help of a breast lift, but this may require breast implants to get a fuller cup.
- Empty sac syndrome- Here, the breasts lose volume leaving the breast envelope as it is. This may leave the breasts looking empty.
- Pseudoptosis- The upper portion of the breasts may appear to be hollow because of a large part of breast being at or below the level of nipple-areolar complex.

Breast augmentation is performed with the help of **breast implants Los Angeles**. The two most commonly used breast implants are saline implants and silicone implants. The saline implants consists of an exterior sack made of solid silicone and is filled with a sterile solution. In case the implant gets ruptured, the saline gets absorbed by the body making it safe to use. Placing saline implants require small incisions as the fluids are filled after inserting the breasts. Silicone breast implants are filled with silicone gel. Many believe that silicone implants give more natural appearing breasts.

However, use of silicone implants have been controversial with some women complaining of serious ailments such as connective tissue devices, neurological diseases and cancer.
